

DOPPIE™ Printer Overview

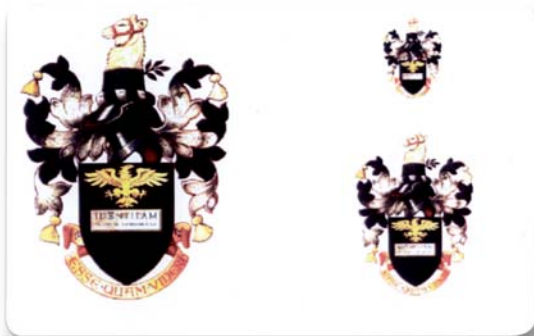

(Direct On Plastic Printer with Imaging Electronics)

We only supply DOPPIE™ printers on account of the quality of their output and reliability.

Displayed are two logos printed onto a card – the logos are printed from the same file; the DOPPIE™ renders the image to a much higher quality both in terms of detail and colour content.

Card printed at 64 levels of colour

Card printed at 256 levels of colour

DOPPIES™ print at 264 levels of colour and true 24 bit colour; competitive machines will print at 64 levels of colour and this is why the images are less good. The DOPPIE™ printers work to a special algorithm that recalibrates the printer head heat after every three passes. Other printers recalibrate after 8-10 passes.

The head is used to melt (vaporise) the ink on the printer ribbons. Hence it is clear to see why the DOPPIE™ gives better results, consistently.

The user will also immediately see that the DOPPIE™ printers are much better engineered and thus the registration of colours – as the card is carried through the printing process – is far superior

The DOPPIE™ is the most reliable and robust printer in its class, as well as the most affordable.
