

ComPic V6

Optional Software Components

Available as a standalone product or optimised to run on a network with a server based database, such as SQL Server, the standard ComPic v6 configuration is enhanced by the addition of optional features and may also be linked with other products from the IDentilam suite of idcardsonline software solutions: *Badge & Track* for recording attendance and/or authentication of card holders, *Card Check* for image retrieval, and *ComPicWeb*, a browser front end for data access and custom workflow.

Any of the following additional features can be added to ComPic Version 6.

Administration

Location link	You can optionally associate a user with a "location" – this could be a department or building etc. The user can then be restricted to viewing records that were created only by their own location.
Offline data entry	If database is unavailable (e.g. if the server is down or data is being entered remotely), then there is the option to enter records into a local database and then synchronised into the live database at a later date.

Database

Live Overlay	ComPic can use another database to derive all, or part, of its data via a 'live' link; ComPic searches the source database for the relevant record and overlays the required data into the corresponding record in the ComPic database.
Automatic database fill	Entry of a key word e.g. a branch name, will automatically populate other fields pre-defined by the user with relevant data e.g. address, tel no. etc
Extra fields	20 extra database fields can be added.
Bulk Image Import	Batches of images can be imported (and automatically cropped if necessary) from an external system.
Auto CSV and Image Import	A regular import can be setup, which will import data and images from an external source. The import details are saved and so can be run again and again, just on the press of a button

Printing

Paper passes	Facility to print a card created for the DOPPIE printer onto A4 paper. Scaleable to required size.
Offline printing	If the printer is unavailable (e.g. if it has broken down), then records that sent to print are "flagged" in the database and when the printer is back online, the flagged records can be printed in a batch. Included in offline data entry feature.

Card Design

IR Barcodes	IR Barcode (3/9) and blocker overlay
Multiple passes	Printing of sequential number onto card, independent of database link
Vestigial image	(Faded photo image) in background of design
Embellishments	Logos, bitmaps, pictograms placed onto card by textual commands (text to graphics) obviating the need for multiple card variations as independent card designs; all graphic representations activated by user configured textual commands, sorting in correct location and in order of priority

Reporting

Class photo sheets	Images printed 8 up per A4 sheet with first 4 fields of record data.
Photo ID sheets	Images printed 8 up per A4 sheet in format of ID cards enabling temporary ID card issue; selection & sorting facility & preview; option of 4 card styles with 4 variable data fields and 2 header fields per card type.
Renewal letters	Automatic issue of standard letter (pre-defined) to selected records in database.
Mailmerge	User friendly 'menu driven' link from ComPic to Word to allow user to create own letters for mailmerge, in conjunction with the ComPic database.
Badge & Track + Event Triggers	When a specified field is populated with a specific value, then that record is automatically booked in for an event(s).
